Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

ptonotifs@yeeiplaw.com

Office Action Summary	Application No.	Applicant(s)	
	10/675,783	LEVINE ET AL.	
	Examiner	Art Unit	
	Jason Mitchell	2193	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE *3* MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1)☒ Responsive to communication(s) filed on *17 July 2008*.

2a)☒ This action is **FINAL**. 2b)☐ This action is non-final.

3)☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4)☒ Claim(s) *6-19* is/are pending in the application.

4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5)☐ Claim(s) _____ is/are allowed.

6)☒ Claim(s) *6-19* is/are rejected.

7)☐ Claim(s) _____ is/are objected to.

8)☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9)☐ The specification is objected to by the Examiner.

10)☐ The drawing(s) filed on _____ is/are: a)☐ accepted or b)☐ objected to by the Examiner.

Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11)☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12)☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

a)☐ All b)☐ Some * c)☐ None of:

1.☐ Certified copies of the priority documents have been received.

2.☐ Certified copies of the priority documents have been received in Application No. _____.

3.☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

1) ☒ Notice of References Cited (PTO-892)

6) ☐ Other: _____.

DETAILED ACTION

This action is in response to an amendment filed on 7/17/08.

Claims 6-19 are pending in this application.

Response to Arguments

Applicant's arguments filed 7/17/08 have been fully considered but they are not persuasive.

Regarding the section labeled "35 U.S.C. § 112, Second Paragraph"

In the last par. the applicants' state:

> Applicants have amended claims 6, 11, and 19 to describe "wherein the functional unit includes at least the instruction cache, the sequencer unit, and the execution units". Therefore the rejection of claims 6-19 under 35 U.S.C. § 112, second paragraph has been overcome.

The examiner respectfully disagrees. The reference to "the functional unit" in line 21 does not have antecedent basis. Specifically, the recitation of "each functional unit" indicates a plurality of units and accordingly it is not clear which functional unit of the "each functional unit[s]" is intended to include "at least the instruction cache, the sequencer unit, and the execution units".

Regarding the section labeled "II. 25 U.S.C. § 103, Obviousness"

In the 2nd par. the applicants state:

> The Examiner takes official notice of identifying a caller of a routine, stating that this is a common use of profiling data. Applicants respectfully request the Examiner to either cite a particular reference that teaches this feature, or withdraw this rejection.

To adequately traverse such a finding, an applicant must specifically point out the supposed errors in the examiner's action, which would include stating why the noticed fact is not considered to be common knowledge or well-known in the art. (See e.g. MPEP 2144.03 (C)). The applicants have not indicated why it is believed the taking of official notice was in error or asserted that 'identifying a caller of a routine' was not known in the art at the time of invention. Accordingly the rejection is maintained. Further see for example US 2004/0163077 to Dimpsey et al. par. [0104].

In the 6th par., the applicants state:

> In contradistinction to both Lueh and Buser, Applicants claim detecting the indicator and the plurality of instructions executing after the indicator has been detected. Therefore, both Lueh and Buser actually teach away from Applicants' claims, because both references teach stopping the execution of instructions in response to detecting a breakpoint. The combination of Partamian, Christensen, and official notice does not cure the deficiency of the combination of Lueh and Buser because the combination does not teach or suggest detecting the indicator and the plurality of instructions executing after the indicator has been detected. Therefore, the combination of Lueh, Buser, Partamian, Christensen, and official notice does not teach or suggest Applicants' claims.

The examiner respectfully disagrees. For example in col. 8, lines 10-16 Lueh discloses "restoring the live global state (Block 526). Those of ordinary skill in the art would recognize this as indicating that execution is continued after halting it to collect the profiling data.

In the 8th par. the applicants state:

> Applicants claim counting events only while said only said plurality of instructions that are associated with the indicator are executing. Lueh teaches profile data

representation 340 including statistics of information during execution compiled and collected by counter 345. Lueh does not teach these statistics of information being counted only while certain instructions, i.e. said plurality of instructions that are associated with the indicator, are executing. The combination of Buser, Partamian, Christensen, and official notice does not cure the deficiency of Lueh because the combination does not teach or suggest counting events only while said only said plurality of instructions that are associated with the indicator are executing. Therefore, the combination of Lueh, Buser, Partamian, Christensen, and official notice does not teach or suggest Applicants' claims.

The examiner respectfully disagrees. First it is noted that the applicants have not indicated a perceived distinction between the claimed "counting events only while said only said plurality of instructions that are associated with the indicator are executing" and the disclosure of Lueh. Accordingly, the applicants' arguments fail to comply with 37 CFR 1.111(b) because they amount to a general allegation that the claims define a patentable invention without specifically pointing out how the language of the claims patentably distinguishes them from the references. Secondly, it is noted that instructions which are not indicated as requiring monitoring (see e.g. col. 5, lines 57-67 "Breakpoints can be implemented using") will not be monitored, thus meeting the claimed limitation.

In the 9th par. the applicants state:

Applicants claim the performance monitor unit being coupled to each functional unit of the processor, wherein the functional unit includes at least the instruction cache, the sequencer unit, and the execution units. The Examiner asserts that Lueh teaches a performance monitor unit being coupled to another code segment or a hardware circuit. Being coupled to a hardware circuit does not teach being coupled to each functional unit, the functional unit includes at least the instruction cache, the sequencer unit, and the execution units. The combination of Buser, Partamian, Christensen, and official notice does not cure the deficiency of Lueh because the combination does not teach or suggest the performance monitor unit being coupled to each functional unit, wherein the functional unit includes at least the instruction cache, the sequencer unit, and the execution units. Therefore, the combination of

> Lueh, Buser, Partamian, Christensen, and official notice does not teach or suggest Applicants' claims.

The examiner respectfully disagrees. While Lueh does not disclose a sequencer unit, the reference does disclose a system in which information is passed between a performance monitor (col. 4, lines 60-65 "counter 345") an instruction cache (col. 8, lines 43-47 "instruction cache") and at least one execution unit (col. 8, lines 40-43 "executes ... instructions"), and this passing of information indicates a coupling of the units (see e.g. col. 3, lines 31-34 "A code segment may be coupled to another code segment or a hardware circuit by passing and/or receiving information"). Buser teaches a system including a plurality of execution units (Fig. 7A Virtual CPU_A and Virtual CPU_B) and a sequencer (Fig. 1, "Prefetch and Decode Logic" 1006). Combination of the references results in the claimed limitations and would have been obvious as discussed below.

In the 2nd to last par. the applicants state:

> Furthermore, there is no teaching, suggestion, or incentive to make the needed changes to reach the presently claimed invention. Absent the examiner pointing out some specific teaching or incentive given in Buser, Partamian, Christensen, and official notice to modify Lueh to implement the combination of all five references, one of ordinary skill in the art would not be led to modify Lueh to reach the present invention when the references are examined as a whole. Absent some teaching, suggestion, or incentive to modify Lueh in this manner, the presently claimed invention can be reached only through an improper use of hindsight using Applicants' disclosure as a template to make the necessary changes to reach the claimed invention. The remaining claims depend from one of the independent claims and are patentable as a result of their dependency.

The examiner respectfully disagrees. Those of ordinary skill in the art would have been capable of implementing the asserted modifications to the Lueh reference with out

producing unexpected results, accordingly the claims are not patentable over the combination presented in the rejection. In other words the distinctions the applicants have noted between the primary reference and the claimed embodiment are little more than alternate methods of implementing a profiling system. Further these methods were known and used in the art at the time of application and thus do not represent patentable distinctions over the prior art.

Claim Rejections - 35 USC § 112

The following is a quotation of the second paragraph of 35 U.S.C. 112:

> The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 6-19 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claim 6 recites "said particular one of the plurality of instructions" (lines 15-16). There is no antecedent basis for this term.

Claim 6 further recites:

> the performance monitor unit is coupled to each functional unit of the processor, wherein the functional unit includes at least the instruction cache, the sequencer unit, and the execution units
> (lines 20-22)

It is not clear which one of the "each functional unit[s]", "*the* functional unit" in line 21 is intended to refer to. Accordingly those of ordinary skill in the art would not be fully apprised of the intended scope of the claim.

Further, the claims make reference to various sets of instructions but do not make clear what, if any, relationship these instructions have to one another. For example claim 1 makes reference to a "plurality of instructions" (lines 3, 4-5, 7-8, 8, 9, 11-12, 22), a "plurality of individual instructions" (ll, 3-4, 6), "instructions which are not associated with the indicator" (ll, 12-13, 17-18), a "particular one of the plurality of instructions" (ll, 15-16, 16, 19, 33-34, 35) and a "only said plurality of instructions that are associated with the indicator" (ll, 25, 27). Further, the claim appears to frequently attribute aspects of one of the sets of instructions to a different set of instructions. For example, the claim recites:

> "a plurality of individual instructions [set B] associated with an indicator that indicates that each one of the plurality of instructions [apparently set A] needs to be monitored" (lines 3-4)
>
> and
>
> "said indicator [an attribute of set B] in said particular one of the plurality of instructions [apparently referring to set A]"
> (lines 15-16)

The examiner believes the claim is intended to refer to a single set of instructions (i.e. an application) in which some of the instructions have been identified as watch points (i.e. instructions for which profiling data should be collected). This is the understanding which will be used for this examination, however, clarification is required.

Claims 11 and 19 make similar recitations and are also rejected for the reasons discussed above.

Claims 7-10 and 12-18 depend from claims 6 and 11 and are also rejected for the reasons discussed above.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

> (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 6-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over US 6,966,057 to Lueh (Lueh) in view of US 2003/0225917 to Partamian et al. (Partamian) in view of US 2004/0030870 to Buser (Buser) in view of US 5,751,942 to Christensen et al. (Christensen) in view of official notice.

Regarding Claims 6 and 11: Lueh discloses profiling an application in a data processing system, the method comprising:

storage that includes a plurality of instructions (Fig. 1, System Memory 140; Mass Storage Device 170), each one of a plurality of individual instructions associated with an indicator that indicates that each one of the plurality of instructions needs to be

monitored (col. 6, lines 1-3 "a location map where the original code needs to be replaced with a branch or trap instruction");

an instruction cache (col. 8, lines 43-47 "instruction cache") and instructions for using said indicator to detect execution of each one of the plurality of instructions, wherein execution of instructions, which are not associated with the indicator, is not detected (col. 6, lines 1-3 "original code needs to be replaced with a branch or trap instruction"; col. 5, lines 57-67 "Breakpoints can be implemented using ... trap patching and code patching" note that instructions not indicated in the "location map" will not be monitored and thus their execution will not be detected);

the instruction cache sending a signal to a performance monitor unit responsive to the instruction cache detecting said indicator in said particular one of the plurality of instructions (col. 7, lines 9-16 "instrumentation code passes necessary information to a run-time library function"; col. 6, lines 1-3 "a branch or trap instruction"), wherein the particular one of the plurality of instructions is located in a routine (col. 3, lines 26-31 "A code segment may represent ... a routine"), and further wherein the signal is not sent to the performance monitor unit for instructions that are not associated with the indicator (col. 6, lines 1-3 "original code needs to be replaced with a branch or trap instruction"; col. 5, lines 57-67 "Breakpoints can be implemented using ... trap patching and code patching" note that instructions not indicated in the "location map" will not be monitored and thus their execution will not be detected), and further wherein the signal indicates that the particular one of the plurality of instructions is being executed (col. 5, lines 57-67 "stop program execution at desired locations"), and still further wherein the

performance monitor unit is coupled (col. 3, lines 31-34 "A code segment may be coupled to another code segment or a hardware circuit by passing and/or receiving information"; note that Lueh's system requires information to be passed between the various components of the system which are thus coupled) to each functional unit of the processor, wherein the functional unit includes at least the instruction cache (col. 8, lines 43-47 "instruction cache"), and the execution units (col. 8, lines 40-43 "executes ... instructions"), and still further wherein said plurality of instructions execute after said indicator has been detected (col. 7, lines 5-8 "interrupts the execution before the field access and modification points to call the event hook function");

the performance monitor unit counting events that are associated with an execution of only said plurality of instruction that are associated with the indicator responsive to the performance monitor unit receiving the signal (col. 4, lines 60-65 "methods that are identified as hot methods"; note that execution of instructions not indicated in the "location map" will not be monitored, i.e. no breakpoint will be encountered), wherein said performance monitor counts said events only while said only said plurality of instructions that are associated with the indicator are executing, and wherein said performance monitor begins counting said events only in response to said receipt of said signal (col. 5, lines 57-67 "Breakpoints can be implemented using ... trap patching and code patching" note that instructions not indicated in the "location map" will not be monitored and thus their execution will not be detected);

a hardware interface providing data collected from the performance monitor unit (col. 4, lines 60-65 "The profile data representation 340 includes statistics ... collected

by a counter 345"; col. 3, lines 23-24 "The present invention may be implemented by hardware");

an analysis tool to identify a caller of the routine (col. 5, lines 10-15 "a mechanism to identify and access the caller's frame context");

the instruction cache for determining whether the particular one of the plurality of instructions is 'hot' (col. 4, lines 60-65 "methods that are identified as hot methods based on the collected profiling information"); and

the instruction cache, responsive to the particular one of the plurality of instructions having been identified as 'hot', generating an interrupt to pass control to a monitoring program (col. 9, lines 14-35 "The execution 640 includes ... executing an event hook function for an event corresponding to the +field watch"; col. 7, lines 5-8 "To support the watch points for fields, the JIT compiler interrupts the execution ... to call the event hook function"), wherein the monitoring program identifies information regarding a caller of the routine (col. 5, lines 11-16 "the JIT compiler provides a mechanism to identify and access the caller's frame context, referred to as unwinding stack frame.").

Lueh does not explicitly disclose determining whether the instruction is 'hot' comprises determining whether the instruction has been executed more often than a threshold value.

Partamian teaches a method of determining whether an instruction is 'hot' comprising determining whether the instruction has been executed more often than a threshold value (par. [0018] "JVM 1120 includes a threshold to determine whether a method is hot or not.")

It would have been obvious to one of ordinary skill in the art at the time the invention was made to compare the profiling information collected by Lueh's "counter 345" (see, col. 4, lines 60-65) to a threshold value, as taught by Partamian (par. [0018]) as an obvious and commonly used method to identify hot methods for recompilation (Lueh col. 4, lines 60-65 "re-compiles methods that are identified as hot methods").

The Lueh-Partamian combination does not disclose the indicator stored in at least one existing spare bit in each one of the plurality of individual instructions. Instead the Lueh reference discloses implementing breakpointing using one of two methods (i.e. col. 5, lines 57-67 "trap patching and code patching").

Further Lueh discloses an instruction cache (col.8, lines 43-47 "instruction cache") and that other aspects of his system "may be implemented by hardware" (see col. 3, lines 23-24) and which may be coupled to ... a hardware circuit by passing and/or receiving information" (col. 3, lines 31-38). Partamian teaches a cpu which contains a plurality of processors (CPU 304 may include … a plurality of processors"). However the Lueh-Partamian combination does not explicitly disclose the instruction cache outputs to

a sequencer unit that subsequently outputs to execution units all three of which are included in a processor.

Buser teaches a third method of breakpointing in which the indicator is stored in at least one existing spare bit in each one of the plurality of individual instructions (par. [0004] "providing an instruction field in every instruction ... actions are performed ... based on the value of the halt identifier field").

Further, Buser teaches an instruction cache (Fig. 1, 1001; par. [0018] "Instruction memory 101 is comprised of instructions") coupled to a processor (Fig. 1, "CPU 0" 1000), that outputs said plurality of instructions to a sequencer unit (Fig. 1, "Prefetch and Decode Logic" 1006) that outputs the plurality of instructions to an execution unit (Fig. 7, Execution Unit 1007) wherein the sequencer unit and execution units are included in the processor (Fig. 1, "CPU 0" 1000).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use Buser's third method of breakpointing in the Lueh-Partamian combination (e.g. Lueh col. 5, lines 57-67) as an alternate means of providing the desired functionality (i.e. breakpoints). One of ordinary skill in the art would have been able to implement the modified system with predictable results.

It would additionally have been obvious to one of ordinary skill in the art at the time the invention was made to implement the suggested profiling and optimization functionality (e.g. Lueh col. 4, lines 60-65 "methods that are identified as hot methods

based on the collected profiling information and generates the optimized native code 360") in a hardware system with an instruction cache (Leuh col. .8, lines 43-47 "instruction cache"; Buser Fig. 1, 1001) that outputs said plurality of instructions to a sequencer unit (Buser Fig. 1, "Prefetch and Decode Logic" 1006) that outputs the plurality of instructions to execution units (Buser Fig. 7, Execution Unit 1007; CPU 304 may include ... a plurality of processors"), wherein the sequencer unit and the execution units are included in a processor (Fig. 1, "CPU 0" 1000). Those of ordinary skill in the art would have been motivated to implement the system in such a way to achieve the various performance gains normally associated with a hardware implementation over a software implementation.

The Lueh-Partamian-Buser does not explicitly disclose the instruction cache (e.g. Lueh col.8, lines 43-47 "instruction cache"; Buser Fig. 1, 1001) is included in the processor.

Christensen teaches an instruction cache (Fig. 1, ICache 120) included in a processor (Fig. 1, "Target Microprocessor" 100).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to include the instruction cache (e.g. Lueh col.8, lines 43-47 "instruction cache"; Buser Fig. 1, 1001) in the processor (e.g. Christensen Fig. 1 "Target Microprocessor" 100; Buser Fig. 1, "CPU 0" 1000). Those of ordinary skill in the art

would have been motivated to do so in order to take advantage of the superior access time of cache memory. Specifically, such a configuration would avoid the need to retrieve instructions from memory (Christensen col. 3, lines 60-65 "instructions enter processor 100 through instruction bus 30 and are stored in instruction cache 120 until they are required by core 110).

Lueh discloses using means to identify a caller of the routine (col. 5, lines 10-15 "a mechanism to identify and access the caller's frame context"); however, the Lueh-Partamian-Buser-Christensen combination does not disclose the using means uses the collected profile data to identify a caller of the routine.

Official notice is taken that identifying a caller of a routine is a common use of profiling data.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use Lueh's collected profile data (col. 4, lines 60-65 "The profile data representation 340 includes statistics ... collected by a counter 345") to determine a caller of a routine. Those of ordinary skill in the art would have been motivated to do so in order to provide the data (e.g. in the form of a call graph) to a user for analysis.

Regarding Claims 7 and 12: The rejections of claims 6 and 11 are incorporated, respectively; further Lueh discloses:

examining a call stack upon generation of the interrupt (col. 5, lines 11-16 "unwinding stack frame."); and

identifying a caller of the routine from an examination of the call stack (col. 5, lines 11-16 "the JIT compiler provides a mechanism to identify and access the caller's frame context").

Regarding Claims 8 and 13: The rejections of claims 6 and 11 are incorporated, respectively; further Lueh discloses the information includes at least one of a caller of the routine (col. 5, lines 11-16 "the JIT compiler provides a mechanism to identify and access the caller's frame context") and a number of instructions executed in the routine.

Regarding Claims 9 and 14: The rejections of claims 6 and 11 are incorporated, respectively; further Lueh discloses:

generating a call graph from the information (col. 5, lines 11-16 "unwinding stack frame.").

Regarding Claims 10 and 15: The rejections of claims 6 and 11 are incorporated, respectively; further Lueh discloses:

selecting the caller of the routine for analysis based on the information gathered by the monitoring program (col. 5, lines 14-15 "The stack unwinding process starts with a frame context of the caller").

Regarding Claims 16 and 18: The rejection of claims 6 and 11 are incorporated; further the Lueh-Partamian combination discloses:

indicating that each execution of each one of the plurality of instructions should be counted (Lueh col. 6, lines 1-3 "a location map where the original code needs to be replaced with a branch or trap instruction");

identifying a threshold value (Lueh col. 4, lines 60-65 "methods that are identified as hot methods based on the collected profiling information"; Partamian par. [0018] "JVM 1120 includes a threshold to determine whether a method is hot or not."); and

a counter to count a number of times each one of the plurality of instructions is executed (Lueh Fig. 3 counter 345; col. 4, lines 60-65).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to include the indication that executions of an instruction should be counted (Lueh col. 6, lines 1-3), threshold value (Partamian par. [0018]), and a counter (Lueh col. 4, lines 60-65) in a first second and third one of a plurality of existing spare bits in each one of the plurality of instructions (Buser par. [0004] providing an instruction field in every instruction ... actions are performed ... based on the value of the halt

identifier field" see the rejection of claims 6 and 11). One of ordinary skill in the art would have been able to implement the modified system with predictable results.

Regarding Claim 17: The rejection of claim 16 is incorporated; further Buser discloses the use of registers for controlling a meaning of each one of the plurality of bits (par. [0021] "the value of CPU halt identifier field 1002 for that instruction is compared to the value of ... a special register within the CPU").

Claim 19 is rejected under 35 U.S.C. 103(a) as being unpatentable over US 6,966,057 to Lueh (Lueh) in view of US 5,896,538 to Blandy et al. (Blandy) in view of US 2004/0030870 to Buser (Buser) in view of US 5,751,942 to Christensen et al. (Christensen) in view of official notice.

Regarding Claim 19: Claim 19 primarily recites a combination of the limitations addressed separately in claims 6-10 and 16-17.

Further, Blandy teaches a threshold value used to identify a hot method (col. 3, lines identifies the hot modules ... After a module has been called a certain number of times") similar to, and resulting in the same obvious modifications as the Partamian teaching relied upon in the rejection of claims 6-10 and 16-17.

Still further, Blandy teaches a "performance monitor may track the cycle time for a module" (col. 3, lines 8-10). Accordingly it would have been obvious to one of ordinary

skill in the art at the time the invention was made to use cycle time for the threshold value as an alternative means of determining a hot method.

Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

2004/0163077 to Dimpsey et al. teaches identifying a caller using profile information (see par. [0104]).

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jason Mitchell whose telephone number is (571) 272-3728. The examiner can normally be reached on Monday-Thursday and alternate Fridays 7:30-5:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Bullock Lewis can be reached on (571) 272-3759. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
